PREFACE

This research was conducted under Project 7719, Air Force Personnel System Development on Selection, Assignment, Evaluation, Quality Control, Retention, Promotion, and Utilization; Task 771902, Research on Prediction and Assessment of Adaptability to Air Force Life.

Appreciation is expressed to Mr. Jim Friemann and Sgt D.E. Fitzgerald of the Computer and Management Sciences Branch for their professional and technical assistance in computer programming and accomplishment of desired analyses. Special appreciation is expressed to Sgts S.R. Truax and G.J. Germadnik for their technical assistance in test administration and compilation of data.

EFFECT CF AN ALL-VOLUNTEER FORCE ON INPUT INTO THE SCHOOL OF MILITARY SCIENCES, OFFICER TRAINING PROGRAM

I. INTRODUCTION

With the implementation of the volunteer force, personnel concerned with national defense and security have questioned whether a sufficient number of volunteers will be available to meet military commitments in the draft-free era. Surveys of prevalent attitudes of military and civilian personnel toward voluntary service as well as actual experience under lowered or non-existent draft call periods have given the services some indication of the impact of the volunteer concept on the overall number and quality of personnel who can be expected to enter the armed forces under draft-free conditions (Hause & Fisher, 1968; Cook, 1970; Cook & White, 1970; Rhode, Gelke & Cook, 1970; Gates Commission Report, 1970; Valentine & Vitola, 1970; Saber Volunteer Report, 1971; Vitola & Valentine, 1971; HumRRO, 1972; Vitola & Alley, 1972).

In the area of officer procurement, results of research imply that the draft has, in the past, had a substantial effect on the flow and quality of personnel into officer commissioning programs (Fechter, 1967; Nichols, Saeger, Driessnack, House & Reid, 1971). In Air Force research, one study of AFROTC cadets indicated that enrollments into advanced training are motivated to some extent by draft pressure and that there are significant differences in aptitude between self- and draftmotivated cadets (Guinn, Alley & Farmer, 1971). Another survey of Officer Training School students estimated the percentage of true volunteers entering that officer training program ranged from 36 to 54 percent depending on the particular method of estimation used (Chapel & Albright, 1971). To date, no research has been accomplished to give insight into the attitudes of precommissioned officer candidates toward voluntary military service since the military pay raise became effective in November, 1971. To provide information of this type, this study was designed to estimate the effect of the draft on officer input into the School of Military Sciences, Officer, during fiscal year 1972 and part of fiscal year 1973 and the extent to which these officer candidates might choose to enter officer training in the absence of the draft. Comparisons were made between prior service and non-prior service, prospective pilots and navigators, and self- and draft-motivated trainees on the basis of aptitude,

attitude, and demographic characteristics. The data obtained for this study present general trends which can provide a useful basis for assessing the probable impact of zero-draft conditions on input into one of the major Air Force officer training programs.

II. METHOD

Riographical and attitude survey forms were administered to 3,931 male officer trainees during the first week of training in the School of Military Sciences, Officer (SMS-O) (now called Officer Training School), at Lackland Air Force Base, Texas. The population included male trainees who entered in Classes 72-01 through 73-03.

Each trainee completed an Officer Attitude Survey, PA 7010. The answer sheet contained no name identification and there was a clear statement that responses were to be kept strictly confidential and used for research purposes only. Air Force Officer Qualifying Test (AFOQT) scores for each respondent were obtained from class rosters and matched to survey data by Social Security Account Number (SSAN).

In the analyses, comparisons were made between groups of officer trainees categorized by their expressed attitude toward military service under zero-draft conditions and their draft vulnerability based on assigned draft lottery number. Classification of trainees by attitude toward voluntary military service was based on a survey question concerning their willingness to enter officer training in the absence of the draft. Draft vulnerability for non-prior service trainees was derived from their ordinal position in the draft lottery sequence. Trainees with numbers 1 through 122 were identified as the high vulnerability group; those with numbers 123 through 244 as the medium vulnerability group; and those with numbers 245 through 366 as the low vulnerability group. Prior-service trainees, a majority of whom entered service before the establishment of the draft lottery system, were not classified by draft vulnerability.

Further comparisons were made between groups of subjects categorized by prior service/non-prior service, rated/non-rated, and draft/self-

motivated status. Prior-service personnel included all trainees who had previous enlisted service before entering officer training. These trainees included entrants who had been selected for programs such as the Airman Education and Commissioning Program (AECP), Bootstrap, and the Airman Commissioning Program, Rated/nonrated status was based on the individual's survey response regarding his anticipated assignment after completion of SMS-O training. Potential rated personnel included those trainees who indicated that their next scheduled assignment was to undergraduate pilot or navigator training. Those non-prior service (NPS) personnel who did not indicate they were scheduled for some type of rated training were included only in the total NPS and total SMS-O analyses. Non-rated personnel included those prior-service trainees who indicated their next anticipated assignment was entrance into a non-rated technical training course or direct assignment to the field in a non-rated specialty.

Draft motivation groups of primary interest were categorized into self-motivated (true volunteer) and draft-motivated (non-volunteer) trainees. Draft-motivated trainees included those subjects with high vulnerability who stated that they definitely or probably would not have entered officer training if there had been no draft. Included in the self-motivated group (true volunteers) were trainees who expressed definite or probable willingness to enter officer training in the absence of the draft and were included in the low vulnerability category indicating little or no draft pressure to enter service.

The significance of differences between subgroups of interest was determined by results of chi square analyses or t-tests, where appropriate.

III. RESULTS AND DISCUSSION

Extent of Draft Motivation

One of the major questions associated with the implementation of the volunteer force is whether a sizeable proportion of the officer training input has been influenced by draft pressure to enter training. If the amount of draft pressure is found to be minimal among the training program, then no problem in attracting a sufficient number of college graduates to fulfill junior officer requirements for that training would be anticipated.

Expressed attitude by vulnerability category for prior and non-prior service trainees is presented in

Table 1. From the variation in expressed volunteer attitude among vulnerability groups, it appears that actual or perceived draft pressure is a definite motivating factor in influencing young college graduates to enter officer training. In the total non-prior service trainee group, 28 percent indicated that they definitely or probably would not have entered military service in a draft-free environment and 58 percent expressed a definite or probable intent toward volunteerism. These percentages are quite similar to the actitudes expressed by AFROTC cadets (Guinn et al., 1971). In response to the same question, 56 percent of all AFROTC cadets in advanced training expressed a favorable attitude toward voluntary military service with 30 percent expressing a negative attitude. Of special note is the larger proportion of the prior service trainees expressing a volunteer attitude (73 percent). These trainees were not categorized by draft vulnerability since a majority of this group had no lottery number when they entered service. Based on these percentages, it appears that the recently established Airman Commissioning Program and educational programs such as AECF and Bootstrap would provide a valuable source of junior officers in a volunteer environment. Moreover, previous research has indicated that officer input from the various educational programs leading to college degree and subsequent commissioning not only express a greater degree of volunteerism but also career motivation (Shenk, 1972).

A further breakdown of the total group into tentative rated/non-rated status indicated a difference in attitude toward voluntary military service among prospective pilots, navigators, and nonrated personnel Among the non-prior service personnel, 62 percent of the potential pilots, and 50 percent of the navigators expressed a volunteer attitude (see Tables 2 through 4). For the prior-service group, 70 percent of the pilots, 46 percent of the navigators, and 75 percent of the non-rated personnel indicated a similar attitude. It should be noted that 86 percent of all prior-service trainees are categorized as non-rated. The smaller proportion of prior-service navigators expressing volunteerism may be somewhat unreliable since only four percent of the prior-service group (N=37) were considered potential navigator personnel.

A comparison between the results of this survey with results of a 1971 AFROTC cadet survey indicates that the rated subgroups of officer trainces in the School of Military Sciences program expressed a lesser degree of volunteerism and a

larger degree of non-volunteerism (Table 5). For both source of officer input, however, it appears that the potential pilots expressed a more favorable attitude toward voluntary service than the other subgroups. For the non-rated category, prior service officer trainces in the School of Military Sciences program appear to be more volunteer oriented than their NPS AFROTC counterparts. Based on the magnitude of expressed non-volunteerium among AFROTC cadets in the non-rated status, it was articipated that some

problems might be experienced in attracting a sufficient number of personnel for the non-rated specialties in a draft-free environment, especially in the scientific and engineering (S&) areas (Guinn et al., 1971). Results of the current survey indicate that prior-service personnel represent a good source for the non-rated categories. One way to augment the number of officers in any specific non-rated specialty would be to enlarge Government subsidized educational programs related to these career fields.

Table 5. Comparison of Survey Results between AFROTC Cadets and Military Sciences Officer Trainees by Rated/Non-Rated Status

		Express	Attitude Toward	Voluntary Mili	itary Service	
	Definite/i Volum		Undec	ided	Definite/I Non-Voi	
Trainee Category	AFROTC %	IAS OUT %	AFROTC %	MS Off %	AFROTC %	MS Off 1

Potential navigators Potential non-rated	68	50	16	16	16	34
personnel	44	75	15	11	41	14

AFROTC sample contains only NP: personnel.

bMS Off sample includes only NPS personnel for pilot and navigator categories; only prior-service for non-rated category.

Although the number of officer trainees in the various minority categories was extremely small, the data, by race, are presented to indicate general tendencies. The total group (including both prior and non-prior service trainees) was categorized into the following subgroups: Negro. Spanish

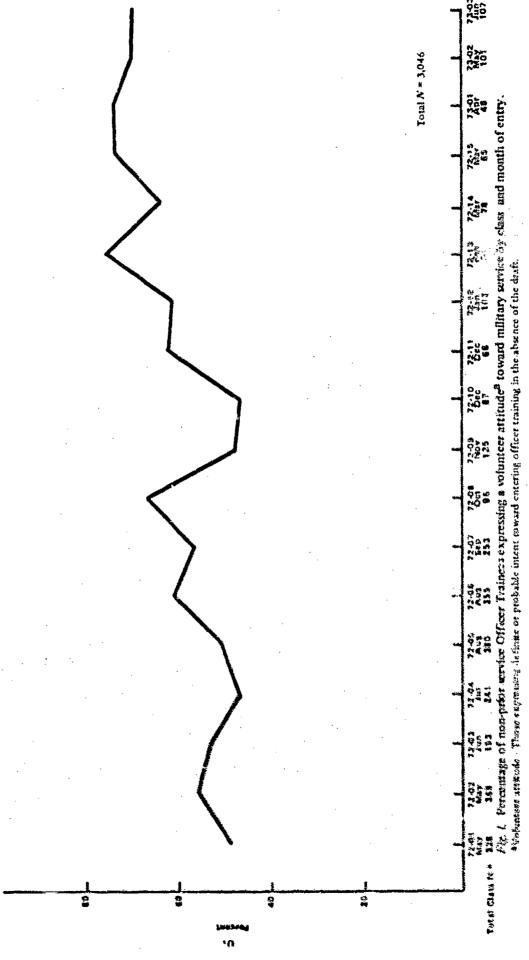

speaking (Mexican-American and Puerto-Rican), and Caucasian/Other. Table 6 shows their expressed attitude toward voluntary military service. Although a greater percentage of the minerity groups express volunteerism, these differences were not found to be significant.

In November 1971, the military pay bill became effective. Since a raise in basic pay has been considered an extential step in attracting a volunteer force of acceptable size and quality, expressed attitude toward voluntary military service was studied by class to ascertain whether a change in redunteerism was perceptible after the pay bill was enacted. In Figure 1, the percentage of non-prior service trainees expressing a volunteer attitude is plotted by class. More detailed breakouts of each class group by attitude and vulnerability estegory are included in Tables Al through Alb in Appendix A. Starting with Class 72-09, which entered training on 9 November

1971, the trend in volunteer attitude appears to increase gradually with a noticeable difference in expressed indunteerism between the first three elasses of FY 72 and FY 73. The peak in expressed volunteerism evident in Clais 72-08 may reflect anticipation. If the actual pay increase which fostered a more positive attitude among entravistic toward voluntary military service. Results of chi-square enalyses reveal that classes prior to the blovember time period do differ significantly in their attitude toward voluntary military service from the post-blovember entrants. Although the mutivating influence of the pay raise appears to be promiting, a portion of the experienced increase in

and the substitution of the first of the fir

favorable attitude may be attributable to factors other than the pay raise. Since the post-November classes were much smaller than those entering prior to November, and during the time when they entered, there was little or no draft pressure, the majority of these entrants may have been volunteer oriented regardless of the 1971 pay raise. In addition, the overall decline in antimilitaristic attitude on college campuses and the scarcity of employment opportunities in the civilian sector may have contributed to the slight increase in positive attitude.

Overall, it should be noted that the percentage of volunteers among the various groups of officer trainees was based on actual input into the School of Military Sciences, Officer training program and may not accurately reflect the number of prospective volunteers in the entire applicant pool. The percentage of trainees in the high vulnerability category coupled with their expressed attitude against voluntary military service indicate that a sizeable number of these accessions were most likely draft-induced. Due to enrollment limitations, some of these draft- induced entrants with higher aptitude qualifications may have excluded potential volunteers who would be available for the volunteer force.

Comparison of Subgroups

Chi square analyses and t-tests were computed to determine the significance of differences between subgroups of primary interest on various demographic, attitudinal, and aptitudinal variables. These analyses included comparisons between subgroups relevant to the particular content area. In general, comparisons between self-and draft-motivated trainees were of primary importance. Unless specifically stated, all differences discussed below were found to be statistically significant at or beyond the 0.05 level.

Motivation to enter training. Recruiting personnel are interested in factors which motivate young men to enter service. In a volunteer environment, these motivating factors become even more important in order to design effective recruiting appeals and strategies. When asked their major reason for entering officer training, self-motivated trainees in all groups indicated a "desire to become a pilot or navigator" was foremost (Table 7). Among the draft-motivated, the alternative "to avoid draft pressure" was selected as their most popular reason with "desire to become a rated officer" second. The priorservice group selected "financial reasons" as their

primary reason with "opportunity for advanced education, technical or professional training" as their second most popular alternative.

The primary reason for entering officer training selected by these officer trainees is interesting from another standpoint. In estimating the characteristics of the future volunteer force, various techniques can be used to categorize the sample population into groups for comparative purposes. When dividing the sample into self- and draft-motivated groups, some question arises as to whether the self-motivated trainees accurately represent the volunteer population. From the primary reasons selected, it appears that the self-motivated group can be considered true volunteers. "To avoid draft pressure" was not selected by any trainee identified as self-motivated. In contrast, at least 47 percent of each draft-motivated group selected that alternative as their primary reason. This suggests that the differences found between volunteer (selfmotivated) and non-volunteer (draft-motivated) groups are, in fact, true differences, and that self-motivated officer trainees do reflect the characteristics of a true volunteer.

Academic background. The college majors of officer trainees are presented in Table 8. An examination of their academic backgrounds helps to give an overall indication of possible overages and/or deficits which might be experienced in obtaining a sufficient number of officers with specific skills and technical knowledge in a volunteer force. Comparisons between self- and draft-motivated trainees indicated no significant differences between these two groups although a somewhat larger percentage of trainees with engineering backgrounds were categorized as draft-motivated. Based on these results, little if any change from the academic background of current officer accessions should be experienced in the volunteer situation.

Geographic location of college. In a zero-draft environment, it is advantageous to identify those college campuses where intensified recruiting efforts might be beneficial. Colleges attended by the sample population were grouped into the major recruiting areas and Table 9 indicates the percentage of officer trainees who attended colleges located in the various recruiting regions. Regional comparisons made between volunteer groups of rated personnel were the only ones which revealed significant differences. Colleges in the Southwest appear to be locations especially favorable to volunteer recruitment, This appears to

be particularly true for the volunteer navigator group. Next to the Southwest region, pilot volunteers are more likely to come from the South-Southeast and Far West regions, with navigators coming from the Great Lakes and South-Southeast regions. Those areas where the smallest percentage of volunteer rated personnel were found are the North-Northeast and Mid-Atlantic regions for self-motivated pilots and Mid-Atlantic, Far-West for self-motivated navigator personnel. It is realized that the percentages of personnel from a certain area are dependent in part on the number of colleges in that particular area which more than likely reflects the area's population density. Nevertheless, it does appear that intensified recruiting on college campuses in a speciale recruiting region from which volunteers have come in the past might be effective in the future.

Career motivation. Proponents of the volunteer force have suggested that one of the valuable by products of such a force will be a concomitant increase in personnel retainability (Gates Commission Report, 1970). If a prospective junior officer is motivated to enter service in the absence of the draft, theoretically he will more likely be career motivated also. It was anticipated that this increase in retainability should nelp in offsatting any projected decline in officer accessions, and at the same time, reduce costs which are associated with a high rate of turnover.

Although expressed attitude toward a military career does not accurately reflect actual career decision at the end of an initial tour, some indication of career motivation can U ascertained from an individual's perception of a military caster and his expressed occupational plans for the future. Two survey items were designed to elicit such information. One item asked respondents to compare the desirabilit; of a military career to a civilian occupation. Responses to this item shown in Table 10 indicated that a majority of trainces perceived a military career equally or mo.: desirable than a civilian occupation (59 percent of the NPS trainees and 81 percent of the prior-service personnel). Among the rated categories, 68 percent of the self-motivated pilot trainees and 81 percent of the self-motivated navigator sample perceived a military career to be equally or more favorable than the draft-motivated pilots (32 percent) and navigators (33 percent). In contrast, only a small percentage of the selfmotivated groups (13 percent for pilots; 4 percent for navigators, and 10 percent of the total NPS group) expressed a negative view toward a military

career as compared to the draft-motivated contingent (39 percent of the pilots; 40 percent of the navigators, and 40 percent of the total NPS group). Compared to the total NPS input, prior-service personnel exhibit a more positive outlook toward a military career. Negative feelings are expressed by only 10 percent of the orior-service personnel compared to 19 percent of the total NPS group. These high percentages of volunteer junior officers with a favorable outlook would tend to suggest that a higher retention rate among these personnel could be anticipated.

Table 11 reflects officer trainee responses on their intent to remain in service upon completion of their initial tour. In all instances, self-motivated trainees expressed a more favorable career intention than draft-motivated. In every subgroup, at least 48 percent of the self-motivated subgroups stated that they definitely or probably would remain on active duty while less than 20 percent of the draft-motivated expressed a similar inclination. Negative attitudes toward an AF career were far more prevalent among the draft-motivated trainees. Among prior-service personnel, 82 percent would be amenable to a service career with only 4 percent against it. These percentages of prior-service personnel are noteworthy when compared to the total non-prior service group (40 percent expressed a favorable attitude and 13 percent responded negatively).

Of some concern is the sizeable proportion in most subgroups who indicated some uncertainty toward career commitment. Only for prior-service personnel is the percentage in the undecided category extremely small (14 percent). Such a tiend is to be expected for prior-service personnel since these individuals have already invested some time in their military career and probably would not have entered commissioning programs without a positive attitude toward a possible Air Force career. A longitudinal analysis of career intent by source of commission revealed that over 80 percent of the Officer Training School-AECP group consistently report they will definitely or most likely make a career in the Air Force and 88 percent actually do elect to remain on active duty (Shenk, 1970; 1972). While a generally high percentage of officer trainees in the current sample expressing a positive career intent is encouraging, it must be recognized that those expressing uncertainty represent a probable loss to the Air Force at the termination of their initial tour.

Selection test performance. Of equal importance to the overall number of potential officers who will be available for a volunteer force is the

quality of personnel who will be attracted to enter military service in a draft-free era. It has been recognized for some time that the draft motivates a sizeable number of young men with high aptitude qualifications to enter service (Valentine & Vitola, 1970; Guinn et al., 1971). In most comparisons between self- and draft-motivated accessions, the self-motivated group, on the whole, exhibits lower aptitude test performance than those who are draft motivated. It is realized that an exact appraisal of the aptitude level of the future force should include the qualifications of both volunteer accessions as well as potential volunteers in the applicant pool who were not selected. Volunteer candidates actually selected for the School of Military Sciences, Officer training program more than likely represent the "cream" of the volunteer applicant pool and, as a group, may reflect somewhat higher aptitude performance than performance levels which will be actually experienced in a draft-free environment. Nevertheless, to give some indication of the quality level of the volunteer officer based on actual accessions, comparisons between self- and draft-motivated trainees and between self-motivated trainees and the total sample were made. Further comparisons between the performance of NPS and prior-service personnel, and between entrants before and after November 1971, are also presented.

Comparisons on officer quality, verbal, and quantitative composites are presented in Table 12. Results of t-tests between means of the NPS self- and draft-motivated groups indicated that the two groups of NPS officers differed significantly only on the quantitative composite where the difference between these groups was approximately seven percentile points. While the difference in quantitative ability between draft motivation groups is quite dramatic, the volunteer group is only slightly lower (one percentile point) than the quantitative ability of all current officer accessions.

Comparisons between total NPS and priorservice personnel indicated that differences between these two groups on all three composites were significant at or beyond the 0.05 level. In the officer quality and verbal areas, prior-service personnel excel; in the quantitative area, NPS personnel demonstrated higher mean performance. The lower quantitative performance of priorservice personnel, coupled with similar performance of the volunteer group, appears to indicate that the volunteer officer candidate of the future may be somewhat lower in quantitative aptitude than is today's officer accession.

The aptitude composites for potential NPS rated personnel (pilot; navigator-technical) reflected no significant differences between self-and draft-motivated groups (Table 13). For pilots and navigators, the self-motivated group exhibited slightly higher performance in these two composites than the total group.

During recent months, a concerted effort has been made to attract minority group members to enter officer training. Although the number of trainees in the various minority groups was small, gross comparisons of aptitude performance among the racial groups are presented in Table 14. Comparisons based on officer quality and verbal

composites indicated that mean differences between Negroes and Caucasians were significant. For the quantitative comparisons, Caucasian performance was significantly higher than both the two minority groups. Due to the small numbers in the minority categories, the reflected differences can only be interpreted as general tendencies.

The last series of aptitudinal comparisons focuses on differences between NPS individuals entering training before or after the date of the military pay increase in November 1971 (Table 15). For the self-motivated groups, no significant differences were found between the pre- and

post-November entrants on any composite. It is interesting to note that although the differences were not significant, the post-November self-motivated rated groups demonstrated slightly higher mean performance.

Since there has been a great deal of interest in the overall effect of the pay increase on quality, pre-post comparisons were made for the total NPS input. In comparing mean performance for all subgroups, significant differences were found only for the pilot and navigator-technical composites. For the NPS pilot group, significantly higher mean performance was exhibited in the pre-November group. However, opposite results were found for the navigators; post-November performance on the navigator-technical composite was significantly higher.

Based on these results, the impact of the pay increase on quality level appears non-existent in a majority of subgroup comparisons and conflicting in rated comparisons for the total NPS group. Since the overail quality of the volunteer groups studied appears to be at an acceptable level, perhaps little or no change should be expected. It may be that the facilitating effect of the pay raise will be manifested in attracting a sufficient number of volunteers rather than effecting a significant change in the quality of entrants.

IV. GENERAL SUMMARY AND CONCLUSIONS

A survey of 3,931 trainees in the School of Military Sciences, Officer program indicate that a certain proportion of young college graduates entering this program were movivated to do so by draft pressure. The number of trainees expressing a volunteer attitude toward military service differs among subgroups of potential rated and non-rated, prior-service and non-prior service, and minority personnel. An overall increase in expressed volunteerism is evident in classes entering training after the military pay increase became effective.

Quality differences between draft motivation, racial, and prior service subgroups were quite evident in the quantitative area. No difference in

performance on rated composites was found between draft motivation groups. Comparisons between volunteer pre- and post-November entrants indicate no significant increase in quality as a result of the military pay increase. Such a trend emphasizes the importance of identifying non-monetary incentive programs which can be used effectively to maintain an acceptable level of quality in the future volunteer officer force.

A survey of career intention among these junior officers indicates that a large proportion of the volunteer group are undecided about their future military career. To minimize the loss of these qualified officers, the need to develop improved career incentive programs is apparent.
